

Assalam o Alaikum Sir,

Over the past few months, I have been working on the **Ask PERA chatbot** with the objective of improving its response behaviour and overall performance. Up to **15 March 2026**, I continuously worked on updating and refining the chatbot, and as a result, its responses are now much better and more accurate compared to the previous version.

At present, I am working on the **Authority Chatbot**, which is aimed at providing higher management with a quick and comprehensive summary for any specific time period. This chatbot will be able to show which station performed well, which station issued the highest number of challans, and which station collected the highest overall amount. It will also provide details of each requisition, including who created it, how many inspections were carried out against it, which officer performed better, which officer imposed more challans, and what ratio of those challans was actually paid.

In addition, the chatbot will help identify suspicious activities, highlight which officer performed what kind of work during a specific period, and show which officer contributed more to areas such as **price control requisitions, land eviction**, and other operational tasks. It will also provide a complete overview of the total challans imposed by PERA so far, the amount collected, and the ratio of paid and unpaid challans.

This project required extra time because I had to collect data from different APIs and then clean, organize, and structure it properly so that the chatbot could generate accurate and meaningful responses. This effort is important to ensure that the system provides quick, reliable, and useful summaries.

This project is almost complete, and **insha'Allah**, I expect to deliver it within the next **two weeks**. Once completed, it will enable higher authorities to get a complete summary of any station or officer's performance through a single message within seconds.

After this, I plan to start work on a **real-time alert system** to detect suspicious and unusual activities. This system will help higher authorities understand what is happening and support them in making better and more informed decisions regarding specific unusual activities.
